

## Reasons for CHMODING

CHMODing files can be done for a variety of reasons. You can CHMOD files to do things such as: mark them executable, give them write permission, restrict access to them, and a variety of other reasons. It is important to note that chmoding is nearly impossible to avoid. If you are trying to run a certain cgi script it could require execute permissions on the script itself, write permissions on a directory, and read on an informational page. Your cgi scripts should contain the proper documentation to inform you of the proper CHMOD's.
